Project Description

Project idea

The project focuses on testing the Automation Exercise website, which provides a practice environment for learning and applying software testing techniques. The idea is to design and execute test cases that validate the functionality, usability, and reliability of the website's features.

Brief Description

This project involves creating, executing, and documenting test cases for the “Automation Exercise” website. The scope includes testing core features such as user registration, login/logout, product browsing, cart management, checkout process, and contact forms. Both manual, automated and API testing approaches are applied to ensure comprehensive coverage. The project highlights the use of boundary value analysis, equivalence partitioning, and regression testing principles. Defects are logged and reported with proper documentation.
